Summer 1991 Issue

Vol 2 No. 2

New in '91

This windmill, which was originally located on the Garnet Dunsmore farm, was donated to the Museum by his son, Joe Dunsmore. It has been moved to the Museum, repaired , painted and erected. A pump from the Museum collection was added, and the windmill, which stands 40 feet tall, now can be seen pumping water.

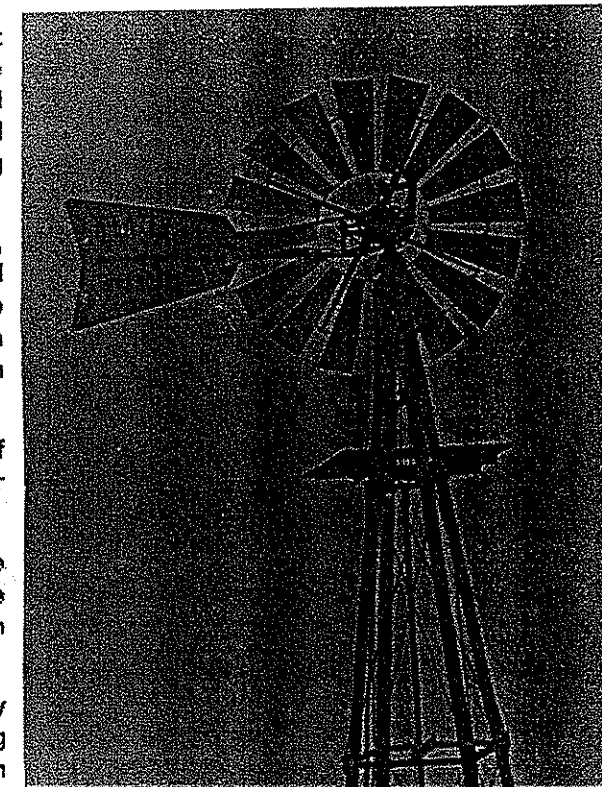

The Diesel engine shelter, shown at the bottom of the page, was mostly built in the fall of 1990. It has now been completed and painted. It has proved to be an adequate shelter for the three engines under it. We have received, from England, a set of decals for each of the Ruston Hornsby elevator engines, together with painting instructions and a full set of manuals.

The Pasqua Hospital has given our museum a couple of additional pieces of steam equipment. One is a 17 horsepower turbine, coupled to a pump. It was made by Babcock Wilcox.

The other is a Westinghouse air compressor, of a type used on steam locomotives to operate the brakes. We plan to have one or both of these machines operating during our Demonstration Day on Sept 14th.

At the time this is written, plans for the new office/display building are being drawn, and estimates of material costs are being received. Preliminary planning calls for a 40 by 60 foot building with an 8ft wide veranda on two sides. The location will be next to Qu'Appelle Ave. between the Diesel shelter and Hillburn Church. The plan to go ahead will of course depend, among other things, on getting the necessary permits.

Work has begun on the restoration of the big American-Abell "Cock of the North" steam tractor. The first item is to get the boiler ready for a cold water pressure test, by the time the Boiler Inspector gets here. Further work will then be subject to his decision. If we get the go-ahead, we plan to use it to power the Pasqua generator.
